1 Response Functions

All response functions (\underline{G} , $\underline{\alpha}$, ϵ , etc.) have to fulfill a certain set of easily testable relations. First, they have to fulfill reality in time domain and thus the crossing relation in frequency domain

$$\underline{G}(-\omega, \mathbf{r}, \mathbf{r}') = \underline{G}^\dagger(\omega, \mathbf{r}, \mathbf{r}') , \quad (1)$$

$$\underline{\alpha}(-\omega) = \underline{\alpha}^*(\omega) , \quad (2)$$

$$\epsilon(-\omega) = \epsilon^*(\omega) , \quad (3)$$

$$r(-\omega) = r^*(\omega) . \quad (4)$$

$$(5)$$

Furthermore, in most cases one can rely on reciprocity of the Green's tensor

$$\underline{G}(\omega, -\mathbf{k}, z) = \underline{G}^\top(\omega, \mathbf{k}, z) . \quad (6)$$

In order to test the Green's tensor's reality, one can use that

$$\underline{G}_{\Im}(\omega, \mathbf{k}, z) = \frac{\underline{G}(\omega, \mathbf{k}, z) - \underline{G}^\dagger(\omega, \mathbf{k}, z)}{2i} = \frac{\underline{G}^\dagger(-\omega, \mathbf{k}, z) - \underline{G}(-\omega, \mathbf{k}, z)}{2i} = -\underline{G}_{\Im}(-\omega, \mathbf{k}, z) , \quad (7)$$

$$\underline{G}_{\Re}(\omega, \mathbf{k}, z) = \frac{\underline{G}(\omega, \mathbf{k}, z) + \underline{G}^\dagger(\omega, \mathbf{k}, z)}{2} = \frac{\underline{G}^\dagger(-\omega, \mathbf{k}, z) + \underline{G}(-\omega, \mathbf{k}, z)}{2} = \underline{G}_{\Re}(-\omega, \mathbf{k}, z) . \quad (8)$$

However, it is more feasible to compare the integrated quantities

$$\int \frac{d^2\mathbf{k}}{(2\pi)^2} \underline{G}_{\Im}(\omega, \mathbf{k}, z) = - \int \frac{d^2\mathbf{k}}{(2\pi)^2} \underline{G}_{\Im}(-\omega, \mathbf{k}, z) , \quad (9)$$

$$(10)$$

2 Power Spectrum and Friction

Another relevant quantity in the context of the noncontact friction is the power spectrum \underline{S} (see for example [?]). Here, we find the testable relation

$$\underline{S}^\dagger(\omega) = \underline{S}(\omega) . \quad (11)$$

Moreover, one should be able to retrieve the static case

$$\lim_{v \rightarrow 0} \underline{S}(\omega) \sim \frac{\hbar}{\pi} \theta(\omega) \underline{\alpha}_{\Im}(\omega) . \quad (12)$$

Additionally, one can test the integration of $\underline{\alpha}$ in the first order in α_0 .

$$\int_0^{\omega_{\text{cut}}} d\omega \underline{\alpha}_{\Im}(\omega) \sim \begin{cases} \frac{1}{2} \alpha_0 \omega_a & \text{for } \omega_{\text{cut}} \gg \omega_a \\ \alpha_0^2 \int_0^{\omega_{\text{cut}}} d\omega \int \frac{d^2\mathbf{k}}{(2\pi)^2} \underline{G}_{\Im}(\mathbf{k}, z_a, \omega + k_x v) & \text{for } \omega_{\text{cut}} \ll \omega_a \end{cases} \quad (13)$$

3 Test Case: Free Space

In free space for temperatures $k_{\text{B}}T \gg \hbar\omega_a$ one finds (see `VacuumGreen.pdf`)

$$F = -\frac{v}{c} \frac{k_{\text{B}}T\alpha_0}{6\pi\epsilon_0} \frac{\omega_a^4}{c^4} \quad (14)$$

Furthermore, one can test the individual Green's tensor integrations via the relations given in the `VacuumGreen.pdf`. With respect to the polarizability one finds

$$\int_0^{\omega_{\text{cut}}} d\omega \, \underline{\alpha}_{\mathfrak{G}}(\omega) \sim \begin{cases} \frac{1}{2} \alpha_0 \omega_a & \text{for } \omega_{\text{cut}} \gg \omega_a \\ \alpha_0^2 \frac{\omega_{\text{cut}}^4}{8\pi\epsilon_0} \text{diag} \left[\frac{c}{3(c^2-v^2)^2}, \frac{c(c^2+v^2)}{3(c^2-v^2)^3}, \frac{c(c^2+v^2)}{3(c^2-v^2)^3} \right] \stackrel{v \ll c}{\approx} \mathbb{1} \alpha_0^2 \frac{\omega_{\text{cut}}^4}{24\pi\epsilon_0 c^3} & \text{for } \omega_{\text{cut}} \ll \omega_a \end{cases} \quad (15)$$
